

ABSTRACT

5 A fabric for clothes that has a decreased flow
resistance shows a compression ratio of a micro-area in
the fabric surface, on the surface side opposite to a
body, of from 8 to 90%, and has streaky protruded
portions on the surface side opposite to body. The
protruded portions preferably have a width of 100 to
2,500 mm, and a height of 30 to 300% of the width of the
10 protruded portions. Moreover, the protruded portions are
preferably wavy, streaky ones in one direction on the
surface side opposite to a body.
